Activity 1: Interactive and Visually Appealing Dashboards

The core design principles — including a Clear and Intuitive Layout, Color and Theming, Interactive Filters, and Responsive Design — have been applied to create the Food Ordering Behaviour Analysis Dashboard. Below are the key outcomes and insights surfaced by the analytical interface:

- **Regional Order Concentration:** The Cities by Order Volume bubble chart isolates the highest-performing markets among Bangalore, Chandigarh, Delhi, Hyderabad, Mumbai, and Pune, highlighting the critical operational need for city-specific resourcing and delivery capacity.
- **Group Dining Behaviour:** The Analysis of Orders Across Company Type and Meal Type chart displays a direct link between dining company (Alone, Family, Friends, Partner) and meal-time ordering volume, showing that group orders concentrate heavily around specific meal times.

- **Cuisine Demand Diversity:** The Flavors Across Cities chart reveals that cuisine preference is not uniform across cities — certain cuisines occupy disproportionately larger shares of orders in specific cities, supporting the case for city-tailored menu and restaurant-partnership strategies.
- **Meal-Time Revenue Distribution:** The Revenue Contribution by Meal Type breakdown clearly benchmarks Breakfast, Lunch, Dinner, and Snacks against one another, visually documenting that Lunch and Snacks generate substantially higher revenue shares than Breakfast.
- **Dynamic Cross-Filtering:** By implementing interactive legends and filters for City, Cuisine, Meal Type, and Company Type, business stakeholders can instantly filter the entire dashboard by a specific segment, enabling real-time exploration of ordering behaviour and consumer trends.
