Activity 1: Story Design:

Tableau Story Narrative & Observations

By leveraging the sequential story point structure in Tableau, the Food Ordering Behaviour Analysis presentation guides business stakeholders through a logical progression of ordering metrics, turning raw transaction records into a cohesive consumer-trends narrative titled “Food Ordering Behaviour and Consumer Trends: A Structured Analysis.”

Based on the interactive story points, here are the core observations:

- **Platform Stability:** Food ordering platforms maintain high stability, reflecting consistent order flow across the tracked period rather than volatile demand swings.
- **Dietary Diversity:** Consumer behavior reflects high dietary diversity with robust demand spread across cuisines (Biryani, Chinese, Desserts, Fast Food, North Indian, South Indian), rather than reliance on a single dominant cuisine.
- **Healthy Geographic Spread:** Geographic distribution confirms a healthy market across all six tracked cities (Bangalore, Chandigarh, Delhi, Hyderabad, Mumbai, Pune), rather than concentration in just one region.
- **Regular Dispatch Performance:** Operational dispatch networks achieve highly regular delivery timing, indicating consistent logistics performance across order volumes.
- **Group Dining Patterns:** Social dining patterns reveal that group orders (Family & Friends) make up a substantial share of total orders, pointing to opportunities for group-oriented offers.
- **Interconnected KPI View:** An interconnected view of corporate KPIs links overall metrics — order volume, ratings, delivery time, and revenue — into a single unified story rather than isolated charts.
